Resume Project for Web Typography, built with HTML and CSS. An attempt at coding a resume using a template which was to be customized and created through our own work experience. Built in VS Code, a combination of HTML and CSS. Throughout the project my perception changed in regard to what I wanted this to be. Learning grid layout helped frame the resume, and grid template areas helped to get more specific regarding the shape of the document, being able to customize more specific areas of the document. In the beginning it was difficult to customize something that had been developed already, but became easier to manipulate as knowledge around the grid layouts grew. It is meant to be seen in full screen, although there is some implementation of @media adjustments, though it is not fully understood. Once the grid layout was workable, more adjustments were made to the actual styling of the design. It was also difficult to made adjustments within the document once other styles were established without affecting them as a group, some were isolated but some changed the entire layout. With more time now that the fundamental elements are understood, the project could take a larger leap forward towards being a fully-functional digital resume. Please let me know what you think and if any obvious changes could be made, all criticism is welcome.
